AutoCAD Crack+

AutoCAD offers a variety of functions that can be used to create 2D and 3D drawings. When creating a 2D drawing, for example, a user can select an object, modify its properties, draw shapes around the object, and then apply object-specific drawing commands. The user can then save the drawing to a file. When creating a 3D drawing, a user can draw a model, add a hierarchy of 3D elements to the drawing, and then attach non-structural objects, such as furniture, scenery, and lighting fixtures, to the model. AutoCAD is also used in a variety of ways to help analyze and manage complex, multilayered drawings, including dimensioning, area planning, and other modeling applications. References 1. * Plugins for managing objects (see Object-Oriented Drawing) and creating new parts (AutoCAD Analyst) can be created for the following fields: Drawing: Geometry, Layer, Property, Text, Text Item, Part, Feature, View, Arc, Multigroup, Undo. AutoCAD Architecture: Architecture Part, Building Project, Architecture Project, Building Project Elevations, and Bill of Materials. * Automation: The ability to automate tasks that allow one to enter drawing information from external sources such as spreadsheets, text documents, databases, etc. (see Data-Oriented Drawing). Objects: You can create new objects in your drawings, use them to represent various pieces of a drawing, and modify their properties. You can also use the object manager to search, modify, and retrieve existing objects. Associations: You can create associations between drawings and other objects such as people, parameters, scenes, etc. Associations are defined in terms of properties. Data-Oriented Drawing (Data-Driven Drawing) Data-Oriented Drawing, or Data-Driven Drawing (DDD), is the capacity to use data that has been captured from the outside world to modify the properties of objects. Data can be in the form of a spreadsheet, database, text document, graphics, or any other type of file. **FIGURE 4.7 Schematic of data-driven drawing capabilities.** You can open a spreadsheet or database file to create data that will automatically be used to populate the properties of the objects in your drawing. The objects in your drawing are pre-loaded with the data from the external file. The following screenshot shows the data in a database file imported into the drawing. The database file is a Microsoft Excel file containing one row of data in each of the columns of the drawing table. The data from the database file is used to populate the drawing. **FIGURE 4.8** Objects are automatically populated with data from an external source. **NOTE** Data-Driven Drawing can also be used for files that are not configured to load into AutoCAD. For example, an illustration from a PowerPoint presentation can be used to populate the objects in a drawing. Data-Driven Drawing provides an excellent way of creating annotations in your drawings. For example, a title can be created in the PowerPoint file and automatically ca3bfb1094
